

(Learning Process) - Easy

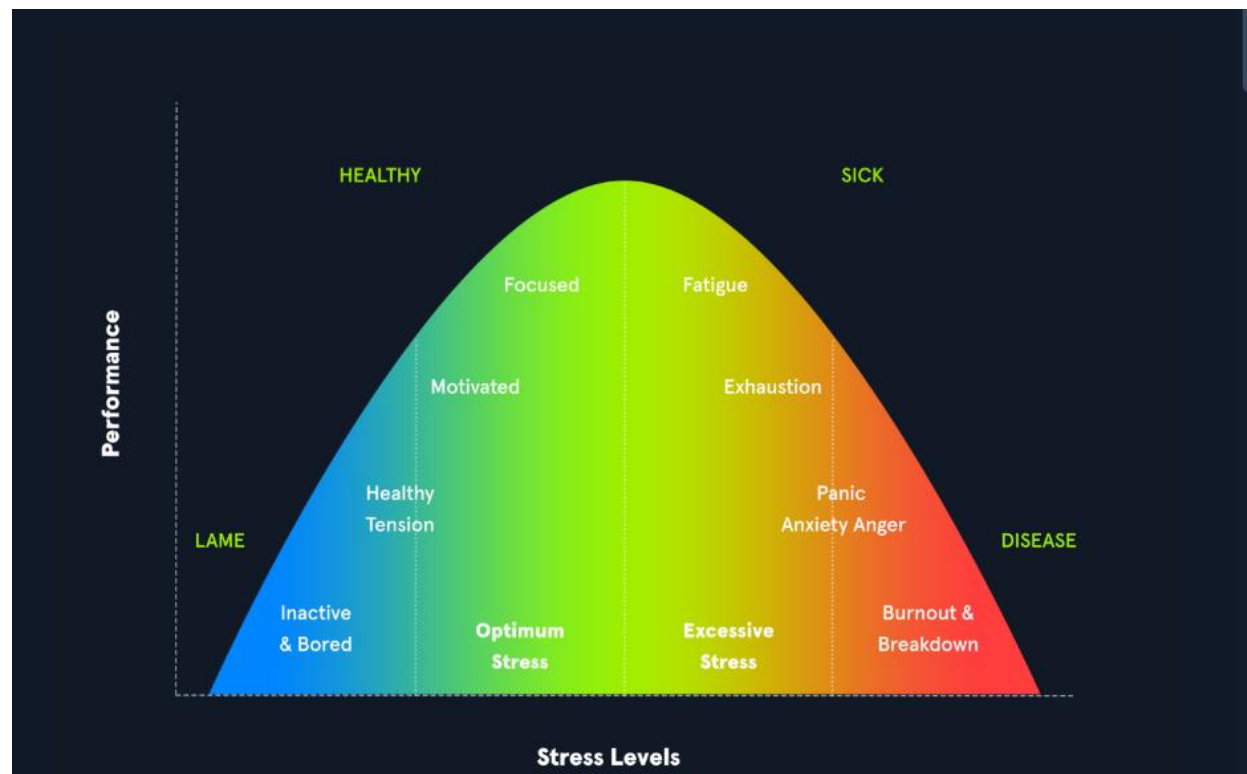

This module covers various stages of the learning process, such as: Mindset, Learning Efficiency and learning types, Documentation, Organization, Focus, Attention, and Dealing with Frustration.

“Module: 1 Learning Process”

- We know that not every person is right. We must learn how to find, choose, adapt, and most importantly learn!
- Solve the following equation: $20 * _ + 415 = 65535$
 - I decided to divide and conquer until I got close to the remainder of 65535. I ended up with $20 * 3256 + 415 = 65535$. After this initial answer I also saw an
 - After this module I asked myself why I did not manipulate the equation further. For example, changing syntax and numbers, after being asked this question, I decided to follow this and manipulate the equation and found an easier way to go about this problem. Instead of the latter, I could have done $20 + 65535 = 65535$! Simple!
- O Cram's Razor: the most straight forward theory is the most preferable to all the several other sufficient possibilities.
 - If we understand the individual steps it takes to detect or exploit, the concept should be the focus; general knowledge is more important than steps to a process.
 - Ascendence of general knowledge will make it harder to adapt to new challenges that one may face.
 - Thing “outside the box” is more important when you are in the hacker mindset. The problem is an emotional state. Without emotions, it is merely just a situation.
 - A problem without a goal will not yield successful outcomes
- We must fail; it is unavoidable and essential to learning!
 - The Pareto principal states that with 20% of effort, we can achieve 80% of the effect.
 - Efficiency depends not only on the quality of information we find, but on the usage of that information. This depends on our motivation, focus, and goals.
 - Stay motivated by looking at your progress. Compare where you started knowing. It is the only constant when learning takes effect.

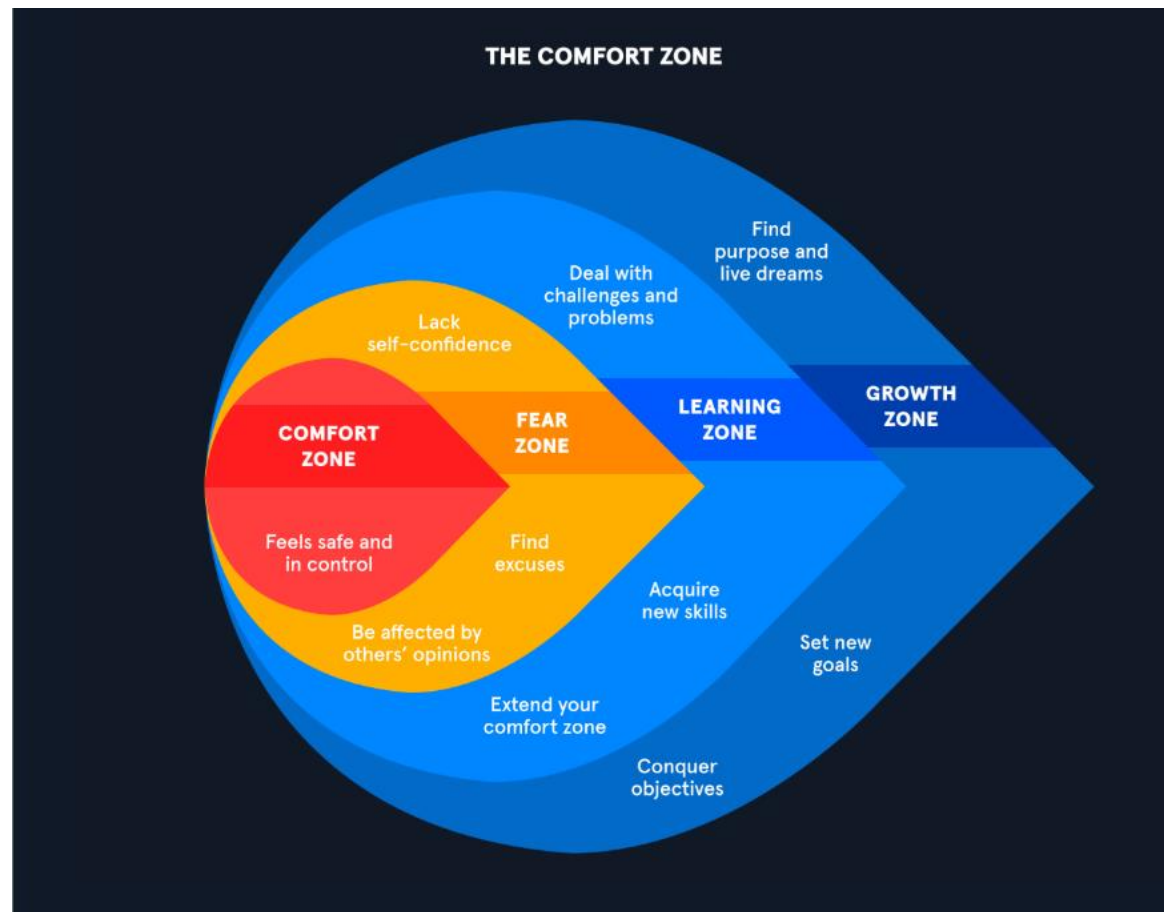

- However, we can still get stuck. There are many ways to become stuck the main ones being we focused too hard and lost the context of the takes or we are tired and did not take enough breaks.
- The human brain develops regions based on psychological changes when we learn something new.
 - When reading the latest information an individual process has started, a reaction to an external information influence that we inwardly interpret and process.
 - Subconscious and conscious thoughts are processed during states of being awake and asleep.
 - Consciousness describes mental processes by which we become aware of external factors and are aware of our internal observations. Unconsciousness happens internally without being acknowledged externally by ourselves.
- Will is a construct to presuppose a conscious decision to act in a rational manner.
 - Will is commonly seen as striving for a planned goal. Before we decide on a goal to achieve, we must become clear about what we want in as much detail as possible. Explain to yourself what you want and how it must feel to achieve the goal! This process can be defined by “dreaming”
 - Fear is a state and the product of our imagination of the future and its consequences where the present is suppressed,
 - But we are already beginning to program (adjust) ourselves to fail. So, let us ask if this fear is called for:
 - Have we already worked through all the material?
 - Have we already seen what is being taught and how it is being taught?
 - Do we already have to have the skills that are expected of us?
 - If we answer "no" to these three questions, it should be clear that we are afraid of something without even trying it. This leads to the fact that fear, in this case, is not justified.
 - Choosing a specific type of goal will allow one to understand the type of reward or feeling they hope to gain! Because the decision and goal determine how we learn and think about our tasks that we complete.
 - If a person does not know how to use a ladder, they will only get to higher floors with outside help!
 - It is essential to differentiate between focus and attention
 - Attention refers to momentum as it is happening.
 - Focus is on the topic you are dealing with now.

- “Where did I put the keys?” = Attention: “Ok, the keys are not here...” = focus.
- Attention is heavily influenced by focus. Focusing is the purposeful and deliberate alignment to a specific goal!
- Our attention is influenced by interest, needs, personal attitudes, beliefs, orientations, goals, and experiences.
- Identify patterns of your attention span and attitude to get a better grasp when you focus the best.
- Make sure you are comfortable and ready to learn new things and be aware that frustration is inevitable and taking breaks is essential.
- Yerkes-Dodson Law describes cognitive performance as a function of the level of stress/nervousness.

- When we leave our “comfort zone, we enter an area that we are not similar or know much about. This lowers our ability to operate and think. Making the process of problem solving much harder.
- Children lack this problem, since children are always eager to learn new things and are not at all phased by making mistakes. FOLLOW

THIS.

- Imagine fear fuels us to become scared of an imagined future without considering the present. The more visceral you make the imagined future, the worse your fear will manifest.
 - “The difference between a winner and a loser is that often the winner loses more than the loser.
 - To offset this fear, change classic phrases like: “I can't do this,” this does not make sense!” add “yet” at the end. So “I can't do this yet” and “This does not make sense, yet!”
 - Only their person on your journey and with the decisions you made can judge you; everything else is just assumptions.
 - Using creativity can help us get out of “dead ends” or mental blocks when learning or performing a complex task.
- Comparing progress from when you first started to where you currently reside is important to view growth and to build confidence in yourself.

- Do not let frustration stop you from reaching a new goal; frustration is an emotion that will pass eventually.
 - Two types of progress.
 - Write down everything that you learned or have known about a topic and rank difficulty with some viable solutions, during a specific period.
 - The other way of recording progress is doing the latter, but continuously.
